

AuricVault® Services :
Bulk Tokenization
& File Sharing

The Challenge:

A call center service collects and then shares credit card information with their clients. Call center service sought PCI Compliance mitigation for both the collecting and the sharing of the credit card information.

The Solution:

The call center leveraged Auric’s PCI capabilities to collect, tokenize, and then de-tokenize sensitive information so they could send information securely to the call center's clients. Sensitive information is now prevented from entering the call center's business environment.

“ The Advantage of building custom solutions for people is that we’re able to tailor them specifically for their existing business environments. Plus, once built there are no on-going per transaction fees with our custom deployments.”

Raymond Côté CEO
Auric Systems International
